

Server Assessments

Information that drives success - Consolidate + Virtualize

Helping you succeed in today's market requires more than technology alone. It requires a deep understanding of your IT specific needs and environment and an ability to provide targeted solutions that deliver measurable results. ProActive's consulting services make it easier and more cost effective for you to do so with our unique Server Assessments. Based on a detailed review of your current server environment, this offering provides specific solution recommendations that increase operational efficiencies while driving down current and long-term business costs. By putting our team's extensive experience, technical skills and proven methodologies to work for you, ProActive's server assessment will enable you to create fully validated, high-value information to help make sound business decisions, increase IT efficiencies and provide valid return on investment (ROI).

Comprehensive server assessments determine the most efficient and cost-effective server solution recommendations. We provide a careful analysis of the server environment, including technical, performance and financial considerations. This leads to a migration path to the optimal server architecture.

Available across all IT platforms, our comprehensive server assessments include the following detailed analyses:

Technical Analysis

- Summarize current server population including: total number of servers and duplicate or redundant server functions that can be consolidated.
- Summarize resources within datacenter environment, including: current "at capacity" server racks and opportunities for application consolidation via virtualization.

Performance Analysis

- Target CPU utilization percentage of server environment during prime time and peak hours.
- Determine success of current server environment in meeting required performance levels.
- Identify solution scalability needs.

Financial Success

- Summarize current server hardware and software costs, including: maintenance, warranty, facility, lease payment costs

- Identify potential solution implementation costs including: cost-replacement modeling from current state to future state recommendations; ROI modeling for recommended changes; and planned cost for capacity/performance upgrades.

Detailed Reporting and Recommendations

Our consultants arm you with a detailed report that contains both executive summaries and specific data supporting the recommended changes. As part of the assessment, our consultants also will determine the total cost of ownership of your current server environment in order to provide recommendations that optimize ROI. Enable yourself to make more effective use of your IT budget while fully addressing your server needs.
